1) Abstract — Awareness & Sophistication Theory

Title

Structured Evaluation of Advertising Copy using Awareness and Sophistication Theory

Abstract

Advertising effectiveness depends on aligning message content with the buyer's **stage of awareness** and **level of market sophistication**. Eugene Schwartz's theory defines how messaging must evolve from problem recognition to product familiarity, while sophistication levels dictate how claims must shift from simple promises to mechanism-driven and proof-backed communication. Despite its importance, there is **no computational framework that operationalizes awareness and sophistication as measurable variables in ad evaluation**.

This work proposes a **theory-driven evaluation system** that models advertising copy as a function of awareness-stage alignment and sophistication-level signaling. The system analyzes text to infer the buyer's cognitive stage and evaluates whether the messaging structure, claims, and depth of explanation match the expected persuasion strategy. A scoring mechanism is introduced to detect mismatches such as **advanced claims for low-awareness audiences or weak differentiation in high-sophistication markets**, enabling systematic diagnosis of persuasion effectiveness.

Research Questions

1. Can awareness stage be reliably inferred from linguistic and structural cues in ad copy?
2. How does mismatch between awareness stage and messaging impact perceived clarity and effectiveness?
3. How do sophistication levels influence the required depth (claims vs mechanism vs proof)?

4. Can awareness–sophistication alignment predict ad quality better than surface-level metrics?

Deliverable Output

```
{
  "awareness_stage": "...",
  "sophistication_level": "...",
  "alignment_score": ...,
  "violations": [
    "Message too advanced for problem-aware audience",
    "Lacks mechanism for high-sophistication market"
  ],
  "diagnostic_feedback": "..."
}
```

2) Abstract — Offer Component Framework

Title

Computational Evaluation of Advertising using Structured Offer Components

Abstract

High-performing advertisements follow a structured composition of persuasive elements such as clear entity definition, pain articulation, mechanism explanation, proof, and risk reversal. The “14 Components of Irresistible Offer Messaging” framework formalizes these elements as drivers of perceived value and buyer conviction . However, existing systems lack the ability to **systematically detect, measure, and validate the presence and sequencing of these components in ad copy.**

This work introduces a **component-based evaluation system** that models advertising as a structured assembly of these elements. The system extracts components, evaluates their completeness and strength, and enforces logical sequencing constraints (e.g., value before price, proof before CTA). A scoring mechanism identifies missing or weak components and structural violations, enabling a consistent and interpretable assessment of offer quality.

Research Questions

1. Can ad copy be reliably decomposed into defined offer components?
 2. How does component completeness affect perceived value and persuasion strength?
 3. What role does sequencing of components play in conversion effectiveness?
 4. Which components have the highest impact on overall structural quality?
-

Deliverable Output

```
{
  "components_detected": [...],
  "component_scores": {
    "clarity": ...,
    "mechanism": ...,
    "proof": ...,
    "risk": ...
  },
  "completeness_score": ...,
  "sequence_validity": ...,
  "missing_components": [...],
  "violations": [...],
  "diagnostic_feedback": "..."
```

3) Abstract — Cognitive Cues of Audience

Title

Modeling Cognitive Cues in Advertising for Audience-Aligned Persuasion

Abstract

Effective persuasion relies on activating the correct **cognitive cues** in the audience, such as urgency, trust, effort minimization, social proof, and identity alignment. These cues shape how buyers interpret value, risk, and relevance,

yet current approaches do not provide a **formal system to detect and evaluate the presence and effectiveness of such cues in advertising copy**.

This work proposes a **cognitive cue modeling framework** that treats ad copy as a set of signals designed to influence buyer perception and decision-making. The system identifies key cues—such as urgency (time pressure), credibility (proof signals), effort reduction, and identity reinforcement—and evaluates their strength and balance. A scoring mechanism highlights missing or weak cues and detects overuse or misalignment, enabling a structured analysis of psychological resonance.

Research Questions

1. Can cognitive cues be consistently detected from textual patterns in ads?
 2. How do different cues (e.g., urgency vs trust) contribute to persuasion effectiveness?
 3. What combinations of cues produce the strongest perceived value?
 4. Can imbalance or absence of key cues explain poor ad performance?
-

Deliverable Output

```
{
  "cognitive_cues": {
    "urgency": ...,
    "trust": ...,
    "effort_reduction": ...,
    "social_proof": ...,
    "identity_alignment": ...
  },
  "cue_balance_score": ...,
  "missing_cues": [...],
  "overused_cues": [...],
  "diagnostic_feedback": "..."
```
